

The Story of Rocks

The composition of Earth is made of a hard, solid, and continuous mass. The rocks that make up Earth are all made of the same material, but they have different colors and textures. This is because the rocks are made of different minerals and they have different colors and textures because of the different minerals that they are made of.

Some rocks are made of a single mineral, but most are made of a mixture of minerals. The minerals that make up rocks are made of different elements and they are arranged in different ways. This is why some rocks are harder than others and why some are more colorful than others. Some rocks are made of a single mineral, but most are made of a mixture of minerals.
