

## Getting around in the water

### Observations

Animals live in many different places. They live on land, under the ground, in the air, in ponds and lakes, and in the ocean. Animals that live in water have special parts, such as fins and flat tails, to help them move. They are adapted to where they live.

### Science activity

Color in the animals that live in the water most of the time.

### Science exploration

Set up a small aquarium for a goldfish. Carefully observe how a fish moves.
