

COMPOUND INTEREST (15a)

... INVOLVES ADDING IN INTEREST AT REGULAR INTERVALS, SO YOU'RE EARNING INTEREST ON INTEREST!

LET: P = INITIAL INVESTMENT (\$)
 r = ANNUAL INTEREST RATE (eg, 2% = 0.02)
 n = # OF TIMES, PER YEAR, THAT INTEREST IS ADDED IN; # OF COMPOUNDING PERIODS/YEAR

MONTHLY: $n = 12$ WEEKLY: $n = 52$ DAILY: $n = 365$

AFTER THIS TIME... ... YOU'LL HAVE THIS MUCH \$\$...

<p>1 COMPOUNDING PERIOD</p> <p>2 "</p> <p>⋮</p> <p>$n = 1$ YEAR</p> <p>⋮</p> <p>$2n = 2$ YEARS</p>	<p>$P + P \cdot r \cdot \frac{1}{n} = P(1 + \frac{r}{n})^1$</p> <p>$P(1 + \frac{r}{n}) + P(1 + \frac{r}{n}) \cdot r \cdot \frac{1}{n} = P(1 + \frac{r}{n})^2$</p> <p>$P(1 + \frac{r}{n})^{n \cdot 1}$</p> <p>$P(1 + \frac{r}{n})^{n \cdot 2}$</p>
---	---

$$A = P(1 + \frac{r}{n})^{nt}$$

USING THE COMPOUND INTEREST FORMULA (15b)

$$A = P(1 + \frac{r}{n})^{nt}$$

EX SUPPOSE \$1000 IS INVESTED AT 3% ANNUAL INTEREST, COMPOUNDED DAILY, FOR 5 YEARS. HOW MUCH MONEY WILL YOU HAVE?

$P = 1000, r = 0.03, n = 365, t = 5$

$$A = 1000(1 + \frac{0.03}{365})^{365 \cdot 5} = \$1,161.83$$
