

Measurements of the amount of photosynthetic oxygen that is lost in plants when leaves "light" and respiration occurs "putting together". There are two ways to do it, as well as other important details to watch for in class. The first method uses a closed system in a tank of water. Another method of photosynthesis is oxygen. When using this method they use the oxygen that is lost in plants, and produce the oxygen that is lost.

There are two ways to do it, as well as other important details to watch for in class. The first method uses a closed system in a tank of water. Another method of photosynthesis is oxygen. When using this method they use the oxygen that is lost in plants, and produce the oxygen that is lost.

1. What is photosynthesis? _____
2. How do the leaves of plants measure the photosynthesis rate? _____
3. How do the leaves of plants measure the photosynthesis rate? _____
4. How do the leaves of plants measure the photosynthesis rate? _____
