

Measurements of the amount of photosynthetic products that are produced when leaves "light" and carbon dioxide "locking together" (these are the reactants) as well as water and oxygen (these are the products) are used. The total photosynthetic products produced in a given amount of time are measured in moles. When using these data they can be used to determine the amount of photosynthetic products that are produced when given a certain amount of time and amount of light.

These data can be used to determine the amount of photosynthetic products that are produced when given a certain amount of time and amount of light.

The amount of photosynthetic products that are produced when given a certain amount of time and amount of light can be determined by using the following equation:

$$\text{Amount of photosynthetic products} = \text{Rate of photosynthesis} \times \text{Time}$$

The amount of photosynthetic products that are produced when given a certain amount of time and amount of light can be determined by using the following equation:

$$\text{Amount of photosynthetic products} = \text{Rate of photosynthesis} \times \text{Time}$$

1. What is photosynthesis? \_\_\_\_\_
2. How do the leaves of a plant produce photosynthetic products? \_\_\_\_\_
3. How much photosynthetic products are produced in \_\_\_\_\_ hours? \_\_\_\_\_
4. How do you think about the amount of photosynthetic products? \_\_\_\_\_
