

Information:

Using this morning's USA Weather Map and your knowledge of fronts, pressure systems and likely mid-winter temperatures in the USA - you are to construct 10 likely Station Model plots for cities below. You are also to give a brief weather forecast for each city (see example). Use mid-day temperatures.

To the right is an example for mid-day weather in Roanoke, Virginia. Note that the wind direction from the north west corresponds to the air movement around both the Low near Maine and the High in Florida. There is 100% cloud cover and it is snowing. Pressure is decreasing as the cold front passes so either the High to the south is weakening or the Low near Maine is getting stronger. The dew point is near the current temperature. If the temperature drops much there will be fog and likely more snow.

Roanoke *High today of only 34. NW winds & snow. Colder temps and fog tonight as a cold front passes.*

	Portland, OR _____

	Spokane _____

	San Francisco _____

	Bismark, ND _____

	Tucson, AZ _____

	Green Bay, WI _____

	Denver _____

	Portland, ME _____

	Knoxville, TN _____

	Orlando, FL _____
