

QUESTION 1

Introduction

During the last century, the world has seen a rapid increase in the number of people living in urban areas. This has led to a number of problems, including air pollution, traffic congestion, and a lack of green spaces. One of the most significant problems is the loss of biodiversity. As urban areas expand, natural habitats are destroyed, and many species are lost. This is a major concern for scientists and conservationists alike.

One of the main reasons for the loss of biodiversity is the destruction of natural habitats. As urban areas expand, forests, wetlands, and other natural areas are destroyed. This leads to the loss of many species that are unable to survive in urban environments.

- The loss of natural habitats leads to the loss of many species.
- Urban areas are often built on natural habitats, leading to the destruction of these habitats.
- The loss of natural habitats leads to the loss of many species that are unable to survive in urban environments.
- Urban areas are often built on natural habitats, leading to the destruction of these habitats.
- The loss of natural habitats leads to the loss of many species that are unable to survive in urban environments.
- Urban areas are often built on natural habitats, leading to the destruction of these habitats.
- The loss of natural habitats leads to the loss of many species that are unable to survive in urban environments.
- Urban areas are often built on natural habitats, leading to the destruction of these habitats.

The loss of biodiversity is a major concern for scientists and conservationists alike.

One of the main reasons for the loss of biodiversity is the destruction of natural habitats.

The loss of biodiversity is a major concern for scientists and conservationists alike.
