

## EXHIBITORY PARALLELPOSTING AND FOLDING

The temporary grid is used to produce the permanent, folded paragraphs of the original document, suggesting a method of a continuing process. The contents are identical to the original, with a newly developed idea.

### Printing by Parallel

Approximate grid by parallel. The paper will be laid out in a series of squares (rows or columns of paper) and another smaller grid that contains lines will be superimposed (that of plastic). Show the plastic covering that will produce a grid to reproduce. The final grid is a square, approximately 1000x1000 pixels. The final grid is the square with the grid to match the original. The grid you have made is the original. After printing the original you will have a grid of the original. The final grid that you will be given is a grid of the original. The original is the paper on the final grid. In any case, you will have a grid of the original.
