

Abundance of Isotopes

Chem Worksheet 4-3

Name _____

The **atomic mass** for each element is reported on the periodic table. This number is a weighted average of the masses of each of the isotopes of an element. For example, the atomic mass of carbon is reported as 12.011 amu. Carbon is composed primarily of two isotopes: carbon-12 and carbon-13. The atomic mass is calculated from the relative abundances and the masses for these two isotopes. Using the equation below, we can calculate the atomic mass for carbon.

$$\text{Atomic Mass} = \sum (\text{isotope 1's mass}) (\% \text{ abundance 1}) + \sum (\text{isotope 2's mass}) (\% \text{ abundance 2}) + \dots$$

Carbon-12 makes up 98.90% of all of the carbon atoms, while carbon-13 is about 1.10% abundant. Since the carbon-12 isotope is more abundant, its mass is weighted more in the calculation of carbon's atomic mass. An example calculation is shown below.

Isotope	% Abundance	Mass
Carbon-12	98.90%	12.0000 amu
Carbon-13	1.10%	13.0034 amu

Example

What is the atomic mass of oxygen (weighted average atomic mass)?

$$\text{weighted value 1} + \text{weighted value 2} + \text{weighted value 3} + \dots = \text{atomic mass} = (15.9949 \text{ amu})(97.59\%) + (16.9991 \text{ amu})(2.37\%) + (17.9991 \text{ amu})(0.0354\%)$$

$$\text{atomic mass} = 15.999 \text{ amu}$$

Use the equation for atomic mass to answer the following questions.

- Hydrogen has three naturally occurring isotopes: protium (1H), deuterium (2H), and tritium (3H). Protium is protium's reported atomic mass. Which isotope do you think is the most abundant in nature? Explain.
- Copper is made of two isotopes. Copper-63 is 69.17% abundant and it has a mass of 62.9296 amu. Copper-65 is 30.83% abundant and it has a mass of 64.9278 amu. What is the weighted average mass of these two isotopes?
- Calculate the atomic mass of silicon. The three silicon isotopes have atomic masses and relative abundances of 27.9769 amu (92.2297%), 28.9764 amu (4.6832%), and 29.9738 amu (3.0871%).
- Galium has two naturally occurring isotopes. The mass of gallium-69 is 68.9256 amu and it is 60.108% abundant. The mass of gallium-71 is 70.9247 amu and it is 39.891% abundant. Find the atomic mass of gallium.
- Mercury has two naturally occurring isotopes. Mercury-196 has a mass of 195.966 amu and it is 27.82% abundant. Using the atomic mass reported on the periodic table, determine the mass of mercury-198, the other isotope of mercury.
- Calculate the atomic mass of lead. The four lead isotopes have atomic masses and relative abundances of 203.973 amu (1.4%), 205.974 amu (24.1%), 207.976 amu (22.1%), and 208.977 amu (52.4%).
- Antimony has two naturally occurring isotopes. The mass of antimony-121 is 120.9038 amu and the mass of antimony-123 is 122.9044 amu. Using the atomic mass from the periodic table, find the abundance of each isotope. (Remember that the sum of the two abundances must be 100%.)
