Package dimensions (height x width x depth OR height x circumference):	
Area (square inches or square centimeters) of package available for labeling (any part of the package that can be used for any type of labeling):	
Size of UPC code (for Canadian Information Requests):	

**Component – If a product, such as a loaf of bread, has only one component, you will fill out just one line and list "bread dough" as the component name. If a product has several components, such as an iced cake, you will have one line for the cake batter and a second line for the icing. If you have two or more components that are baked together, you may indicate one finished weight for those components. If you are selling a mix, use the first line for the mix and then on subsequent lines, indicate the ingredients that the consumer adds but make sure it is clear that these ingredients are not in the package. You will need to fill out a formula sheet for each component that you have listed.
