

AIR POLLUTION

Pollution, especially air pollution is becoming a serious problem. Due to this, the air that we breathe is becoming dirtier and more impure.

There are many sources of air pollution. Firstly, the chemical wastes from factories pollute the air with various dioxins and other harmful pollutants. It makes the air dirty. To overcome this problem, we must strict laws for closing down the factories that pollute the air.

Another source of air pollution is the exhaust fumes from cars and other vehicles. They emit poisonous gases like carbon monoxide into the atmosphere and make the air very unhealthy. To combat this problem, we should start using unleaded petrol.

In addition, the open burning of rubbish releases smoke and other harmful gases into the air. This results in many health-related problems. We need to have the people educated in open burning.

Finally, use of a lot of pesticides, chemical fertilizers and pesticides which contain poisonous chemicals. They release toxic gases into the atmosphere. These fertilizers should be banned and natural fertilizers should be used.

Finally, smoke from factories also dirty the air. The smoke which contains polluted particles makes the air unhealthy and results in lung, throat cancer etc. Hence strict laws should be taken against the factories involved. Thus, we should cooperate with the government and control air pollution in our own environment.

WORDS USED
impure - not very refined
dirty - filthy, unclean
leaded - containing lead
polluted - contaminated with
fumes - gas from engine
