

The Earth Is Always Moving

The Earth spins like a top. It is always moving around itself.

The Earth makes a circle around the Sun. There are 365 days and nights. One circle of the Earth takes about 365 days to finish.

The Sun shines on the Earth on 1 side. The sunlight shines only on the side of the Earth facing the Sun. That side is day. The other side is dark. That side is night. As the Earth spins, we move from day to night and back to day again.

Day and Night
