

The pulse of life

Background knowledge

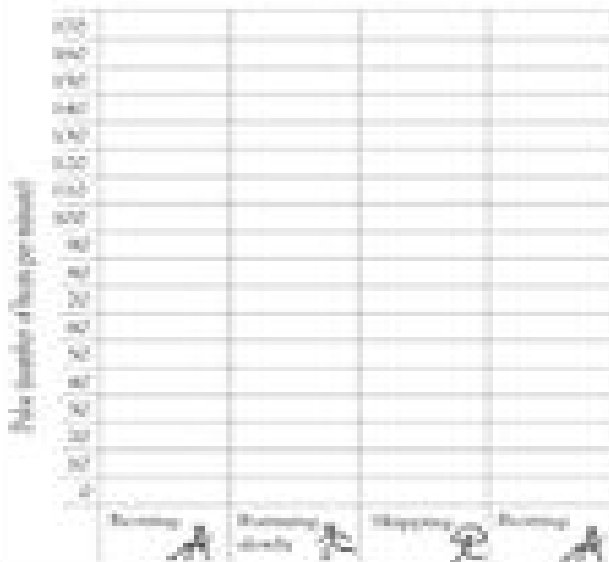

When your heart beats, it pumps blood to parts of your body through vessels called arteries and veins. Arteries carry blood away from your heart to the rest of your body, while veins return blood to your heart. When an artery comes to the surface, you can press a finger against your skin to feel the blood pumping. This is called your pulse. It is a measure of how fast your heart is beating. A child's pulse is usually about 70 to 80 beats per minute.

Science activity

A doctor found that a girl's pulse was 80 beats per minute. After running slowly for 1 minute, her pulse went up to 120 beats per minute. After skipping for another minute, her pulse was 150 beats. After resting for 1 minute, her pulse was 140 beats.

Using the chart below, draw a bar graph of the results. What effect does exercise have on the girl's pulse?

Science investigation

Find your pulse by pressing your first two fingers against the underside of your wrist, below the thumb. Design and conduct an experiment to see how your pulse rate changes after exercise.
