

Revised Techniques

This is a description of the "Revised techniques", sometimes called the "visual-hypnotic observation technique" (with observations/vis observations). This approach has been proposed as a treatment for post-traumatic stress disorder, and essentially consists of instructions for imagined exposure with suggestions for separation/dissociation "dissociation" from the memory. Empirical evidence for the use of this technique in the treatment of trauma is very limited. The use of imagined exposure as part of a treatment plan requires training and only a qualified professional is supported by data though.

The description here is of a technique similar to that used in a 1996 study by Hennrich and Steadell.

1. Relaxation exercises before beginning the re-living, or self-generative induction.
2. Instruction along the lines of: I'm going to ask you to do certain things which will help to relieve the distress caused by recent trauma. I will give directions one-part at a time and then I want you to "go inside" and do it. At each point I will ask you to tell where have done what I ask.
3. I want you to imagine that you are sitting in the middle of a screen. It is dark and there is no-one else there so the screen has been fitted just for you. It's a comfortable seat, like a cinema seat, and you feel quite safe. (Close) when you are there).
4. On the screen you can see a black and white snapshot, or still in which you see yourself just before the traumatic event, just before your hostile experience. (Close) when you are there).
5. Now I want you to think out of your body up to the projection room so the screen is where you can watch yourself watching yourself on screen. From this position you will be able to see the whole cinema including your head and shoulders sitting in the middle of the screen, and also see yourself in the still picture on the screen. (Close) when you are there).
6. When I say so, I want you to feel the snapshot on the screen is a moving film and watch it at the normal pace from the beginning to the end. You will see and feel what occurred at the time, and this might include sound. When you go back to the start of the experience the memory begins to fade, and I want you to stop the film and allow it to become a still again, then moving the film over and experience what happened. (Close) when you have completed this).
7. When I ask you to, then you position in the cinema I want you to go closer to the screen, right up to the still picture, and jump into it; jump inside the experience, seeing everything as if it were happening now. Feel the temperature of the air around you, notice what is going on, be aware of my sound, smell, or taste. This is the film feedback, all the people will move backwards, everything will move its reverse, just like travelling on film except that you are inside this film, and you will experience everything happening in reverse. I want you to do this at about four times normal speed. The film becomes in colour. I want you to experience this as intensely and quickly as you can. When I say "now", go down to the still picture and jump inside the experience and begin reverse-ing. (Close) when you are back at the beginning point and you are full with a good image. You will be able to get back to normal activity quickly.
8. Re-patterning experience, covering different aspects of the events if necessary.
9. Suggest: Whenever your memory is triggered, this revised technique will come in to play until you are back at the safe starting point and you are full with a good image. You will be able to get back to normal activity quickly.
