

Probability Worksheets

This set of worksheets is for introducing basic probability lessons. They are designed to be “experiments” to lead students to conclusions about probability. My students did very well coming up with rules for probability and then generalizing what they had learned to other work. It did require a lot of discussion for them to become comfortable with the vocabulary but the results on their standardized tests were well worth it.

Materials needed:

Two coins for each student

Two six-sided dice for each student

One tin or other container with various numbers of colored chips
