

## From Tadpole to Frog

A tiny tadpole hatches from an egg.

1

The tadpole has feathery gills for breathing underwater.

2

The gills begin to disappear. Back legs begin to grow.

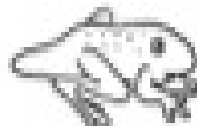

3

Front legs begin to grow. Inside, the tadpole is growing lungs for breathing on land.

4

The tail shrinks . . .

5

. . . and shrinks some more. The eyes and mouth grow bigger.

6

The tadpole has become a frog! Now it will leave the water to live on land.
