

## DNA Replication Worksheet

### The Big Idea!

The structure of DNA, the molecule of heredity, enables the molecule to copy itself.

### Concepts

- DNA is composed of nucleotides and is shaped like a double helix, with strands running antiparallel
- Bases always form complementary base pairs (adenine with thymine and cytosine with guanine)
- Complementary base pairing enables DNA to replicate, or copy itself
- DNA replication involves three steps and each step uses a specific enzyme
- There is a leading strand and a lagging strand for each replication fork
- The lagging strand is made from Okazaki fragments

### PART A

Complete the following strand of DNA by placing the letter of the correct nitrogenous base on the line provided

5'    C    C    A    G    T    A    G    T    T    3'

\_\_\_\_\_

If the DNA molecule above were the parent strand of DNA, when the strands are split for replication, which strand would be the template for the leading strand? Why?

\_\_\_\_\_  
\_\_\_\_\_

### PART B

1. Why does DNA need to replicate?
