

Name: _____

Layers of the Earth

Our planet Earth is constructed of several layers.

Directions: Match the layers to their definitions.

Mesosphere	—	The outermost layer, extremely hot and solid, composed of mostly iron and nickel.
Outer Core	—	The earth's outermost and thinnest layer, hard and rigid, and only a few miles thick under the oceans and averaging 200 miles thick under the continents.
Crust	—	Very thin outer semiliquid layer, the upper mantle on which the plates of the lithosphere float.
Mantle	—	Made up of the crust and a tiny bit of the upper mantle. This layer is divided again horizontally showing plates of solid rock that hold the continents and the oceans.
Asthenosphere	—	A dense layer subdivided into upper asthenous regions made of hot, malleable rock located directly below the crust and about 1,000 miles thick.
Inner Core	—	The only liquid layer of the earth, this layer is made up mostly of iron and nickel. It is located about 4,000 miles below the surface.

Label the layers of the earth below.
