

Starfish

Sea Stars have a flattened body with arms that form a star shape. Brittle Stars have a flat body with a small circle-shaped disk and very long, thin arms. Both Sea Stars and Brittle Stars exhibit a superficially radial symmetry, typically with five or more "arms" protruding from a central body. The arms often have bumps or spines on them. The mouth is underneath the body in the center of the disk.

1. Sea Stars have a flattened body that form a _____ shape.
2. A Sea Star has _____ or more arms.
3. Sea Stars have superficially radial _____.
4. The _____ is underneath the body.
