# Conductors Consulators

What is conductor? It is a material which heat or electricity flows easily through.  
What is an insulator? It is a material which heat or electricity does not flow easily through.

Hypothesis:

Put a check next to the objects that you think will be good conductors.

<input type="checkbox"/> soap	<input type="checkbox"/> magnet	<input type="checkbox"/> nail	<input type="checkbox"/> thumbtack
<input type="checkbox"/> nickel	<input type="checkbox"/> crayon	<input type="checkbox"/> fork	<input type="checkbox"/> eraser
<input type="checkbox"/> penny	<input type="checkbox"/> penny	<input type="checkbox"/> paperclip	<input type="checkbox"/> marble

Experiment:

Test each object using the circuit. To test, hold the wires so that they each touch the object. Look to see if the light bulb lights up. If it does, it is a conductor. If it does not light up, it is an insulator.

Object	Insulator or Conductor?
