

Accidents occur nearly every day. The victims of these accidents sometimes need a lot of blood to replace the amount they have lost, or else they may die, but now-how can doctors get so much blood for people who need it.

Every hospital has a blood bank. This is an organization which collects stores, processes and transfuses blood. The hospital constantly appeal to those who are healthy to come forward and contribute some blood that is collected from the public is kept in the blood bank. Blood banks soon become important as they are often able to save lives by supplying blood to whoever requires it.
