Geology Time Worksheet

Use the following table to compare each stratigraphy geology time. Your description, similarities, and differences must contain at least 50 words.

Time Stratigraphy Method	Description	Advantages of this Method	Disadvantages of this Method
Relative Dating	The relative dating method is to the geologists. It is the arrangement of strata or events in a sequence relative to one another but not necessarily necessarily measured time. Relative dating is the arrangement of strata in a geological sequence or section.	Relative dating is usually required to help determine the absolute age of an object or event by giving birth, such as the formation of a major geological event according to relative dating.	The major disadvantage of the relative dating method is that a clear-cut picture of what events, their dates, dates can be determined the sequential order of events, however, not when they occur.
Stratigraphic Dating	The stratigraphic dating method is the age of sedimentary or volcanic rock is determined on a relative time scale. An example of this is the relative dating method in geology. Relative dating (RD), based on the relative position of strata or features or structures and other events which is described stratigraphic dating.	The stratigraphic dating method is the advantage of the stratigraphic dating method is that it is a relative time scale of an object that is described into a relative time scale. Other such as the relative dating method and relative dating, and based on relative changes in the shape or structure of a sample.	The stratigraphic dating method is the disadvantage of an approximate relative age is that it is not a clear-cut picture of what events, their dates, dates can be determined the sequential order of events, however, not when they occur.

In the following space, explain the role of fossils in determining the geologic column. Your explanation must be between 100 and 200 words.

Fossils reveal information about the climate and other environmental characteristics of the time associated in which they were formed. Comparing early fossils to more recent and organisms
