## Spiders and Insects

Spiders are not insects, although many people think that they are the same. If you look closely at a spider and an insect, you can see how different they are.

An insect has three main body parts. The head is in front. The chest is the next part. The abdomen is behind the chest. Insects also have six legs attached to the chest, three on each side. Most insects have wings attached to the chest.

A spider has two main body parts. The head and chest together make up one part. The abdomen is behind. A spider has eight legs attached to the head-and-chest part, four on each side. Spiders do not have wings.
