

Potential & Kinetic Energy

Potential Energy

- Energy of Position
- Stored Energy (capable of becoming active)

Potential Energy shows a relationship between

- Mass of object
- Height of object
- Acceleration of gravity

An object's potential energy is equal to the amount of work the object can do.

- Work = force x distance
 - Force = mass x gravity (weight)
 - Distance = height

$\text{Potential Energy} = \text{Mass} \times \text{Gravity} \times \text{Height}$ $E_p = mgh$
--

Units:	Potential Energy (E_p)	Joules
	Mass (m)	Kg
	Gravity (g)	m/sec ²
	Height (h)	m
