

The Story of Rocks

The composition of Earth is made of a hard, solid, and continuous mass. The rocks that make up Earth are all made of the same material, but they have different colors and textures. This is because of the different conditions that they have been through.

Some rocks are made of minerals, some are made of organic matter, and some are made of both. The composition of a rock is determined by the conditions that it has been through. For example, a rock that has been through high temperatures and pressures will be made of different minerals than a rock that has been through low temperatures and pressures.
