Sahelanthropus t. 6-7 mya
Skull; *Proconsul?* *Protoceratops?*

Orrorin t. 6 mya teeth, femur;

mya = millions of years ago

bipedal?

Ardipithecus ramidus

- Few fossil remains found so description uncertain;
- Ape-like dentition but transitional between apes and Australopithecines;
- Tooth enamel very thin compared to hominids;
- Hominid type canines – low and blunt;
- Incisors larger than hominids but smaller than chimpanzees;
- more centrally positioned foramen magnum indicating a trend towards bipedalism. (See box on previous page).

4.4 - 4.3 mya; [4-5 mya]

Height possibly slightly smaller than *africanus*; East Africa.

Australopithecus afarensis

- ape-like face;
- flat nose;
- no chin;
- protruding jaws;
- canines smaller than modern apes;
- large molars;
- males much larger than females.

"Lucy"

Common ancestor to Australopithecus and Homo

3.9 - 2.5 mya; [2.5-4 mya]

height 1.07 - 1.52m;

brain size 375 - 550 cm³;

East Africa.

Australopithecus africanus

- flatter face;
- smaller canines;
- larger molars.

3.0 - 2.3 mya;

height 1.1 - 1.4m;

brain size 420 - 500 cm³;

Southern Africa.

Homo habilis

- smaller teeth and jaws;
- this indicates more meat in the diet;
- first to adapt and use stone tools;
- hips form a distinct pelvic bowl;
- near to modern humans in size;
- males and females similar size.

2.4 - 1.8 mya; [1.5 - 2.5 mya]

height 1.0 - 1.5m;

brain size 500 - 800 cm³;

Eastern / Southern Africa.

Homo erectus

- meat formed a significant part of their diet;
- rib-cage barrel-shaped;
- sophisticated stone-tool makers;
- probably used fire.

1.8 - 0.3 mya;

height 1.3 - 1.5m;

brain size 750 - 1225 cm³;

Africa, Indonesia, Asia.

(Δ migration)

Homo neanderthalensis

- large-brained;
- heavy-boned;
- large teeth and jaw muscles;
- brow-ridge above the eye sockets was nearly as prominent as in *H. erectus*;
- limbs were relatively short with respect to the torso (indicating an adaptation to the cold).

150,000 - 30,000 years ago;

height 1.5 - 1.7m;

brain size 1200 - 1625 cm³;

Europe, western Asia.

Homo sapiens sapiens

- large brain;
- face flat rather than projecting;
- molars and canines reduced in size;
- brow-ridge reduced;
- lower jaw is reinforced on the outside producing a chin – this is absent from other hominids;
- general trend towards smaller molars and reduced

130,000 years ago to present;

height 1.6 - 1.8m;

brain size 1200 - 1500 cm³;

Africa and western Asia.
