

### DNA Replication Practice Worksheet

**Concepts:**

- DNA is composed of nucleotides and is shaped like a double helix, with strands running antiparallel
- Bases always form complementary base pairs (adenine with thymine and cytosine with guanine)
- Complementary base pairing enables DNA to replicate, or copy itself
- DNA replication involves three steps and each step uses a specific enzyme
- There is a leading strand and a lagging strand for each replication fork
- The lagging strand is made from Okazaki fragments

**PART A**

Complete the following strand of DNA by placing the letter of the correct nitrogenous base on the line provided

5'    C    C    A    G    T    A    G    T    T    3'

\_\_\_\_\_

If the DNA molecule above, were the parent strand of DNA, when the strands are split for replication, which strand would be the template for the leading strand? Why?

\_\_\_\_\_

**PART B**

1. Why does DNA need to replicate?

\_\_\_\_\_

2. How do base-pairing rules make DNA replication possible?

\_\_\_\_\_

5. Explain three main steps in the process of DNA replication. Name the enzymes that go with each step (HINT: There are 4 main enzymes, 2 of them go with the second step).

a. \_\_\_\_\_

b. \_\_\_\_\_

c. \_\_\_\_\_

6. What are Okazaki fragments? Why are they needed?

\_\_\_\_\_
