

# Use your senses!

## Observations

You have senses that tell you what is happening in the world around you. Your senses give you information about sounds, light, smells, tastes, and what things feel like when touched.

## Science activity

Different parts of your body sense different things. Choose words from the box below to describe what the boy and the dog in the picture are sensing. Label the parts using each word only once.

sound      light      smell      taste      touch

## Science exploration

(1) Take extra care - ask an adult to supervise you.

Can you identify an object with your sense of touch? Place different objects in small paper bags (no sharp objects). Ask a friend to stick his or her hand in the bag and try to identify what's inside.
