

Friction

- ◆ Friction is a force opposing the _____ of one surface over another.
- ◆ The Size of the Force of Friction depends on the following factors:
 1. The roughness of the _____ (e.g. stepping on banana peel compared with carpet)
 2. The force pushing the surfaces together (e.g. A heavy truck's tyres compared with a lighter bicycle's tyres on the road)
 3. Whether the surfaces are moving or _____
- ◆ 3 Types of Friction
 1. Static Friction – acting between 2 stationary bodies (e.g. a person _____ on a chair, _____)
 2. Sliding Friction – acting between surfaces where one is moving (e.g. sliding furniture across the floor, _____)
 3. Rolling Friction – acting between surfaces of objects where one has a rounded shape (e.g. car tyres on the road, _____)
- ◆ 4 Ways to Reduce Friction
 1. Reducing the force or weight pushing both surfaces together
 2. Using a lubricant such as _____ between the surfaces
 3. Using ball bearings or _____ between both surfaces
 4. Polishing both surfaces to make them _____
- ◆ An example where friction is useful is _____
- ◆ An example where friction is not useful is _____
