Read the passage then answer the questions.

OUR SUN

The sun is a huge star found at the center of our solar system. It is made up of hot gases. It gives off light and heat that we can feel on Earth. The sun's energy is important for life on Earth. It helps plants grow and provides us with energy. The sun's light also allows us to see during the day and its heat keeps us warm. The sun is so powerful that all of the planets in our solar system, including Earth, orbit around it. The sun is also responsible for the day and night cycle on Earth, as the Earth rotates around it. Without the sun, life on Earth would not be able to survive.

1. The sun is responsible for the
day and night cycle
2. The sun's is important for life on Earth.
energy
3. The sun is a huge
star
4. The sun gives off
light and heat
5. The sun is found
in the center of our solar system
