Word Problems

The *Serpent Never Sleeps* suggests several math activities. Either make and use an overhead transparency for whole-class discussion or pair or group the students to work together to find solutions. (**Note**: Be sure to cover the answers before displaying this page. If using the metric system, adjust measurements on this page accordingly.)

1. The men and women of the *Sea Venture* worked for hours pumping water from their leaking ship. In one day, 30 tons of water were removed from the ship's storecastle. How much water was that? Use a calculator to determine how many pounds and how many gallons that would be.

    (Remember, one ton = 2000 lbs; one gallon = 8 lbs.)

2. Currently in America, each individual uses approximately 176 gallons of water per day. Pretending the ocean water was clean and drinkable, how many people would have been served by *Sea Venture*'s unfortunate leak?

3. On page 23, Countess Diana is hosting a masque to raise funds for the Jamestown colony in Virginia. "Pitifully, fewer than a fifth of the one hundred ten who went out in 1607, just two years before, were still alive."

    Approximately how many of those colonists were still alive? What year was it?

4. During the six-month "starving time," fewer than sixty of the five hundred settlers had survived. What was the maximum number of settlers who died? What percentage of settlers was that?

5. One night while fishing for supper in the bay, Tom Barlow and Serena caught four tuny "...that must have weighed six hundred pounds between them." On average, what is the weight of each tuny? What fraction of a ton is six hundred pounds?

6. Shortly after the 150 settlers from Bermuda had made it to the colonies, 160 new people arrived at Jamestown. How many new settlers were there altogether? The 150 men, women, and children had sailed in on five ships. If they had been divided equally among the ships, how many people were aboard each ship?

7. Tom built a one-bedroom cabin in Henrico. It had a stone fireplace that was ten feet wide. How many inches is that?

8. The window in Tom's cabin was two feet high by two feet wide. What was the perimeter of the window? What was the area of the window?

Answers

1. 30 x 2,000 = 60,000 lbs; 60,000/8 = 7,500 gal.
2. 7,500/176 = 42 people
3. 110/5 = 22; 1607 + 2 = 1609
4. 500 - 59 = 441; 441/500 = .88 = 88%
5. 600/4 = 150; 600/2000 = 3/10 = 30%
6. 150 + 160 = 310; 160/5 = 32
7. 10 x 12 = 120 inches
8. P =2(l+w) P=2(2+2) P=8 ft.; A= s squared A=2 squared A=4 square feet
