

Chapter 5: Markup & Markdown

Markup

Businesses buy products at a **cost price** and then markup the products to cover the **expenses (overhead)** of running the business and the desired **profits**. The sum of cost plus markup gives the **selling price**, as shown below. **Markup** is also referred to as **margin** or **gross profit**.

$$\begin{aligned}\text{Selling Price} &= \text{Cost} + \text{Markup} \\ S &= C + M\end{aligned}$$

Markup (since it includes expenses and profits) can be rewritten as follows:

$$\begin{aligned}\text{Markup} &= \text{Expenses} + \text{Profits} \\ M &= E + P\end{aligned}$$

Substituting the expression for markup into the selling price equation gives us:

$$\begin{aligned}\text{Selling Price} &= \text{Cost} + \text{Expenses} + \text{Profit} \\ S &= C + E + P\end{aligned}$$

Example 1:

Audiophile Records purchases CDs at a cost of \$12 each. Operating expenses of the business are 25% of the cost and the owner requires a profit of 15% of cost. How much is the markup on the CDs? What is the selling price?

(i) To find the markup, we use the information given about expenses and profit:

$$\begin{aligned}M &= E + P = (0.25 \times C) + (0.15 \times C) \\ M &= (0.25 \times \$12) + (0.15 \times \$12) \\ M &= 3 + 1.80 = \$4.80\end{aligned}$$

(ii) To find the selling price, we now add the markup of \$4.80 to the cost:

$$S = C + M = \$12 + \$4.80 = \$16.80 \text{ per CD}$$

Example 2:

Meteor Lights purchases disco balls for \$67.00 each. Operating expenses are 25% of the selling price and the owner requires a profit of 10% of the selling price. How much should the disco balls be sold for?

Operating expenses are 25% of the selling price, so $E = 0.25 \times S$. Profits are 10% of the selling price, so $P = 0.10 \times S$.

$$\begin{aligned}S &= C + 0.25S + 0.10S \\ S &= 67 + 0.35S\end{aligned}$$
