For perform their many tasks, living cells require Form outside sources. For any enters most ecosystems as and leaves as Photosynthesis generates and that the mitochondria of eukaryotes use as for cellular respiration. Cells harvest the chemical energy stored in organic molecules and use it to regenerate the molecule that drives most cellular work. Respiration has three key pathways: , the , and . A. The Principles of Energy Harvest Cellular respiration and fermentation are catabolic, energy-yielding pathways. The arrangement of atoms of organic molecules represents energy. Enzymes the systematic degradation of organic molecules that are rich in energy to simpler waste products with energy. Some of the released energy is used to do ; the rest is dissipated as . Catabolic metabolic pathways the energy stored in complex organic molecules. One type of catabolic process, , leads to the partial degradation of sugars in the absence of oxygen. A more efficient and widespread catabolic process, , consumes as a reactant to complete the breakdown of a variety of organic molecules. In eukaryotic cells, are the site. Photosynthesis generates and that the mitochondria of eukaryotes use as for cellular respiration. Cells harvest the chemical energy stored in organic molecules and use it to regenerate, the molecule that drives most cellular work. Respiration has three key pathways:, the, and A. The Principles of Energy Harvest 1. Cellular respiration and fermentation are catabolic, energy-yielding pathways. The arrangement of atoms of organic molecules represents energy. Enzymes the systematic degradation of organic molecules that are rich in energy to simpler waste products with energy. Some of the released energy is used to do; the rest is dissipated as Catabolic metabolic pathways the energy stored in complex organic molecules. One type of catabolic process,, leads to the partial degradation of sugars in the absence of oxygen. A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules. Lactic Acid Fermentation	•	To perform their many tasks, living cells requirefrom outside sources.
Cells harvest the chemical energy stored in organic molecules and use it to regenerate, the molecule that drives most cellular work. Respiration has three key pathways:, the, and A. The Principles of Energy Harvest 1. Cellular respiration and fermentation are catabolic, energy-yielding pathways. The arrangement of atoms of organic molecules represents energy. Enzymes the systematic degradation of organic molecules that are rich in energy to simpler waste products with energy. Some of the released energy is used to do; the rest is dissipated as Catabolic metabolic pathways the energy stored in complex organic molecules. One type of catabolic process,, leads to the partial degradation of sugars in the absence of oxygen. A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules. Lactic Acid Fermentation Lactic Acid Fermentation		Energy enters most ecosystems as and leaves as
molecule that drives most cellular work. Respiration has three key pathways:, the, and A. The Principles of Energy Harvest 1. Cellular respiration and fermentation are catabolic, energy-yielding pathways. The arrangement of atoms of organic molecules represents energy. Enzymes the systematic degradation of organic molecules that are rich in energy to simpler waste products with energy. Some of the released energy is used to do; the rest is dissipated as Catabolic metabolic pathways the energy stored in complex organic molecules. One type of catabolic process,, leads to the partial degradation of sugars in the absence of oxygen. A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules. Lactic Acid Fermentation Lactic Acid Fermentation	•	
A. The Principles of Energy Harvest 1. Cellular respiration and fermentation are catabolic, energy-yielding pathways. • The arrangement of atoms of organic molecules represents energy. • Enzymes the systematic degradation of organic molecules that are rich in energy to simpler waste products with energy. • Some of the released energy is used to do; the rest is dissipated as • Catabolic metabolic pathways the energy stored in complex organic molecules. • One type of catabolic process,, leads to the partial degradation of sugars in the absence of oxygen. • A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules. • In eukaryotic cells, are the site.	•	
1. Cellular respiration and fermentation are catabolic, energy-yielding pathways. • The arrangement of atoms of organic molecules represents energy. • Enzymes the systematic degradation of organic molecules that are rich in energy to simpler waste products with energy. • Some of the released energy is used to do; the rest is dissipated as • Catabolic metabolic pathways the energy stored in complex organic molecules. • One type of catabolic process,, leads to the partial degradation of sugars in the absence of oxygen. • A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules. • In eukaryotic cells, are the site	•	Respiration has three key pathways:, the, and
The arrangement of atoms of organic molecules represents energy. Enzymes the systematic degradation of organic molecules that are rich in energy to simpler waste products with energy. Some of the released energy is used to do; the rest is dissipated as Catabolic metabolic pathways the energy stored in complex organic molecules. One type of catabolic process,, leads to the partial degradation of sugars in the absence of oxygen. A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules. In eukaryotic cells, are the site Lactic Acid Fermentation	A	. The Principles of Energy Harvest
 Enzymes the systematic degradation of organic molecules that are rich in energy to simpler waste products with energy. Some of the released energy is used to do; the rest is dissipated as Catabolic metabolic pathways the energy stored in complex organic molecules. One type of catabolic process,, leads to the partial degradation of sugars in the absence of oxygen. A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules. In eukaryotic cells, are the site	1.	Cellular respiration and fermentation are catabolic, energy-yielding pathways.
simpler waste products with energy. Some of the released energy is used to do; the rest is dissipated as Catabolic metabolic pathways the energy stored in complex organic molecules. One type of catabolic process,, leads to the partial degradation of sugars in the absence of oxygen. A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules. In eukaryotic cells, are the site	•	The arrangement of atoms of organic molecules represents energy.
 Catabolic metabolic pathways the energy stored in complex organic molecules. One type of catabolic process,, leads to the partial degradation of sugars in the absence of oxygen. A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules. In eukaryotic cells, are the site Lactic Acid Fermentation 	•	
One type of catabolic process,, leads to the partial degradation of sugars in the absence of oxygen. A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules. In eukaryotic cells, are the site. Lactic Acid Fermentation Lactic Acid Fermentation	•	Some of the released energy is used to do; the rest is dissipated as
One type of catabolic process,, leads to the partial degradation of sugars in the absence of oxygen. A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules. In eukaryotic cells, are the site. Lactic Acid Fermentation Lactic Acid Fermentation	•	Catabolic metabolic pathways the energy stored in complex organic molecules.
° In eukaryotic cells, are the site. Lactic Acid Fermentation	•	One type of catabolic process,, leads to the partial degradation of sugars in the absence of
° In eukaryotic cells, are the site. Lactic Acid Fermentation	•	A more efficient and widespread catabolic process,, consumes as a reactant to complete the breakdown of a variety of organic molecules.
