Science and Technology

In the world today we would see that Science and Technology has taken over everywhere. Do you like Technology? Yes! Everybody likes technology. Some examples of technology are phone, Internet, computer, electricity and etc. Nowadays, almost everything we do requires the use of Science and Technology unlike the past where people use traditional knowledge and physical power to do things.

Take for example, the car. In the olden day, there was nothing like a car. People transport themselves by walking, horse riding, and using the horse cars which aren´t very comfortable.

So today let's look at some advantages and disadvantages of Science and Technology. Some advantages are: (1) **it is faster**; when I use science and technology, it makes me save time, because if I do the work in a short time, I can do a lot many works in the remaining time. (2) **It makes life easier**; for example, I can use computer to replace typewriting and I can use a car, an airplane or a boat to replace walking. (3)**It saves our physical power**; such as I can use the machine to represent my energy.

Some disadvantages are: (1) **It makes people lazy**; sometimes, Science and Technology is convenient and comfort. So, people who use will be lazy to do work. (2) **It is expensive**; for people who can afford it, they can buy many things that made by Science and Technology. But some people can´t buy it because it's too expensive. (3) **Difficult to use**; some technology is hard to use such as computer we have to study first on how to use it.

In conclusion, you will agree with me that science and technology has advantages and disadvantages. So, we should use science and technology in the right and proper way and not using it in the wrong way. So that everybody will benefit from science and technology to develop our country.

Thank you for your attention.
