

Heat and Calorimetry worksheet

Specific Heat Capacity: $c_{p,s}$ for $4.18 \text{ J/g}^\circ\text{C}$

- How much heat is needed to raise 25.0 grams of water from 10°C to 22.5°C ? (ans. $4.0 \times 10^3 \text{ J}$)
 $q = m_{\text{water}} \cdot c_{p,s} \cdot \Delta T = 25.0 \text{ g} \times 4.18 \text{ J/g}^\circ\text{C} \times (22.5 - 10)^\circ\text{C}$
 $= 1280 \text{ J} = 1.28 \times 10^3 \text{ J}$
- Calculate the number of joules released when 75.0 grams of water are cooled from 100°C to 25°C . (ans. $2.53 \times 10^4 \text{ J}$)
 $q = m_{\text{water}} \cdot c_{p,s} \cdot \Delta T = 75.0 \text{ g} \times 4.18 \text{ J/g}^\circ\text{C} \times (100 - 25)^\circ\text{C}$
 $= 25300 \text{ J} = 2.53 \times 10^4 \text{ J}$
- If $1.12 \times 10^4 \text{ J}$ of heat is utilized to raise a water sample and the temperature rises from 90.0°C to its boiling point, what mass of water is in the sample? (ans. 227 g)
 $q = m_{\text{water}} \cdot c_{p,s} \cdot \Delta T$
 $1.12 \times 10^4 \text{ J} = m_{\text{water}} \times 4.18 \text{ J/g}^\circ\text{C} \times (100 - 90)^\circ\text{C}$
 $m_{\text{water}} = \frac{1.12 \times 10^4 \text{ J}}{41.8 \text{ J/g}} = 268 \text{ g}$
- The specific heat capacity of gold is $0.129 \text{ J/g}^\circ\text{C}$. How much heat would be needed to raise 250.0 grams of gold from 25.0°C to 100.0°C ? (ans. $2.40 \times 10^3 \text{ J}$)
 $q = m_{\text{gold}} \cdot c_{p,s} \cdot \Delta T = 250.0 \text{ g} \times 0.129 \text{ J/g}^\circ\text{C} \times (100 - 25)^\circ\text{C}$
 $= 2400 \text{ J} = 2.40 \times 10^3 \text{ J}$
- The specific heat capacity of zinc is $0.386 \text{ J/g}^\circ\text{C}$. How many joules would be released when 47.4 grams of zinc at 100.0°C were cooled to 20.0°C ? (ans. $1.39 \times 10^3 \text{ J}$)
 $q = m_{\text{zinc}} \cdot c_{p,s} \cdot \Delta T = 47.4 \text{ g} \times 0.386 \text{ J/g}^\circ\text{C} \times (100 - 20)^\circ\text{C}$
 $= 1490 \text{ J} = 1.49 \times 10^3 \text{ J}$
- How much heat is absorbed by $1.70 \times 10^2 \text{ g}$ of water and the 450 g of water in a cup is $0.900 \text{ J/g}^\circ\text{C}$ if water they are heated from 10.0°C to 65.0°C ? (ans. $1.00 \times 10^4 \text{ J}$)
 $q = m_{\text{water}} \cdot c_{p,s} \cdot \Delta T + m_{\text{cup}} \cdot c_{p,c} \cdot \Delta T$
 $= m_{\text{water}} \cdot c_{p,s} + m_{\text{cup}} \cdot c_{p,c} \cdot \Delta T$
 $= (270 \text{ g} \times 4.18 \text{ J/g}^\circ\text{C}) + 450 \text{ g} \times (0.900 \text{ J/g}^\circ\text{C}) \times (65 - 10)^\circ\text{C}$
 $= 10000 \text{ J} = 1.00 \times 10^4 \text{ J}$
- What is the temperature change of $1.70 \times 10^2 \text{ g}$ of aluminum which has specific heat capacity of $0.890 \text{ J/g}^\circ\text{C}$ from 80.0°C to
 $q = m_{\text{Al}} \cdot c_{p,s} \cdot \Delta T$
 $1.700 \times 10^3 \text{ J} = 170 \text{ g} \times 0.890 \text{ J/g}^\circ\text{C} \times \Delta T$
 $\Delta T = \frac{1.700 \times 10^3 \text{ J}}{151.3 \text{ J/g}^\circ\text{C}} = 11.24^\circ\text{C}$
