

Gas Law Worksheet Answer Details

1. A cylinder of argon gas contains 50.0 L of Ar at 18.4 atm and 127 °C. How many moles of argon are in the cylinder?

Use Gas Law equation

$$PV = nRT$$

where:

P = pressure

V = volume

n = number of moles of gas

R = gas constant = 0.0821 atm L/mol K

2. Rewrite the combined gas law as if you are solving for V.

$$V_1 =$$

3. Rewrite the ideal gas law as if you are solving for n.

$$n =$$

4. Rewrite the ideal gas law as if you are solving for V.

$$V =$$

5. Write down two reasonable values for R:

Questions 6 - 12. Write down all variables and what values you are given for them. Indicate which variable you are solving for. Also write down the general equation.

6. Solve for the final volume given: The gas inside of a flexible container at 25°C has a pressure of 0.25 atm. The size of the container starts out holding 3 L of gas. When it is heated to 30°C, its pressure is also increased to 0.27 atm. What happened to the volume of the container?

$$P_1 =$$

$$V_1 =$$

$$T_1 =$$

$$P_2 =$$

$$V_2 =$$

$$T_2 =$$
