

Let's start easy!
First....

Ex:
 $3x+4 \overline{) 15x^3 + 11x^2 + 20}$

This problem needs a place holder to work out!!

$5x^2 - 3x + 4 \overline{) 15x^3 + 11x^2 + 20}$

Holder
HA! HA!

All I did was divide it like a regular division problem!!!

Why did you start over the $11x^2$?

I started over that number so the $15x^3$ would cancel out and repeated the process! But, do you see the remainder?! Fix it!!

$5x^2 - 3x + 4 \overline{) 15x^3 + 11x^2 + 20}$

I did it!
It's so easy!
Make it into a fraction like usual!!!

So are you!

Now that I taught you how to divide, how about we go to my place and multiply for a while...

MUSLIM

How dare you!!!

CRACK
