Learning Objectives: Research Methods

THEORY	RESEARCH	DESIGN	DATA	ANALYSIS
<p><b>Behavioral Science</b>  <b>Behavioral Science Theory</b></p>	<p>Behavioral science explains how an individual learns and how the world an individual lives in shapes individual behavior.                      Learning theories are social theories through observation. These theories describe how people learn through reinforcement. In addition to how &amp; when people learn, but the behavior that will be reinforced for each of individuals or individuals in a particular situation.                      Reinforcement theory is an environmental model.                      Reinforcement theory is important for thought and behavior.</p>	<p>Developmental of behavior is the result of interaction.                      Reinforcement is shaped by the environment of reinforcement rather than innate individual nature.                      These behaviors are shaped by reinforcement and learned in a particular situation.                      Behavior modification theory provides a method to an individual reinforced with responses.</p>	<p>For behavior to change and change conditioning, reinforcement (reward, stimuli, response, behavior) must be reinforced through observation &amp; then only be observed.                      Individuals observe the behavior and then learn, work longer and more often to learn, until, when a reward is observed.                      Individuals learn through observation and reinforcement.                      Reinforcement theory is important for thought and behavior.</p>	<p>Reinforcement theory is the most important theory of behavior. For example, children are often taught to read by reinforcing the behavior of reading.                      Reinforcement theory is important for thought and behavior. For example, a teacher who uses reinforcement to encourage students to read more often is using reinforcement theory to encourage reading and learning to read. The reinforcement theory is an individual, a social or can be used together.                      In response to learning, behavior will be shaped to become the behavior of the behavior reinforcement. For example, a child who is reinforced with a reward for reading more often is using reinforcement theory to encourage reading and learning to read.</p>
