

Stems and Root Systems

Instructions:

1. Read the paragraph below and fill in gaps with the given words.

Root system of a plant is spread in the ground directly below the part of the plant that is above the ground. The part of the plant that is above the ground is called the shoot system. The shoot system consists of the stem, leaves and flowers. The shoot system is the part of the plant that grows above the ground.

Stems are the main support of the plant and they also transport water and nutrients from the roots to the leaves. Stems also store food and water for the plant. The shoot system is the part of the plant that grows above the ground.
