

Directions: Answer the questions about photosynthesis.

Photosynthesis is the process by which plants make food to eat. In Greek, photo means "light", and synthesis means "putting together." Plants use the sun's light, as well as water and carbon dioxide, to make their own food. The food plants create through this process is a type of sugar. Another product of photosynthesis is oxygen. When plants make food, they use the carbon dioxide we breathe, and produce the oxygen we breathe.

Plants drink water through their roots, and "breathe" in CO₂ through small holes in the leaves called stomata. These holes only open when photosynthesis must occur. Otherwise, the open holes will allow water to escape.

Once the plant has water and CO₂, chloroplasts in the cells of the leaves take in the water, CO₂, and light, and turn them into sugar and oxygen.

Here is the chemical reaction of photosynthesis:

6 molecules of water + 6 molecules of carbon dioxide
produce
1 molecule of sugar + 6 molecules of oxygen

1. What is photosynthesis?

2. Name the three things necessary for photosynthesis to occur.

3. Write each compound's name: H₂O _____ O₂ _____

O₂ _____ C₆H₁₂O₆ _____

4. What do you think would happen if plants became extinct?
