

# The Story of Rocks

The story of rocks is a story of change and transformation. It tells us how rocks are formed and how they change over time.

There are three main types of rocks: igneous, sedimentary, and metamorphic. Each type is formed in a different way. Igneous rocks are formed from molten magma. Sedimentary rocks are formed from layers of sand, silt, and clay. Metamorphic rocks are formed from other rocks that have been changed by heat and pressure.

The rock cycle is a continuous process. It shows how rocks change from one type to another. For example, igneous rocks can become sedimentary rocks. Sedimentary rocks can become metamorphic rocks. Metamorphic rocks can become igneous rocks.

The rock cycle is a never-ending process. It is a cycle of change and transformation. It is a story of the earth's history.

The rock cycle is a story of the earth's history. It tells us how rocks are formed and how they change over time. It is a story of the earth's past and future.
